Stable thickness measurement with varying distances

The IMS5400-TH absolute interferometer opens up new perspectives in industrial thickness measurements. The interferometer is used for highly accurate thickness measurements from a relatively large distance. The large thickness measuring range allows the measurement of thin layers, flat glass and films. As the absolute interferometer works with an SLED in the near-infrared range, it is possible to measure the thickness of optically non-dense objects such as anti-reflective coated glass.

Reliable even with vibrating materials

A decisive advantage is the distance-independent measurement, where a stable nanometer-accurate thickness value is achieved. This is how the target can move within the measuring range without influencing the accuracy.

With the multi-layer thickness measurement (IMS5400.../MP) up to 5 layers can be measured

The measuring range for air gap measurement (with refractive index ~ 1) is 50 μm to 2.1 mm and for glass thickness measurement (with refractive index ~ 1.5) 35 μm to 1.4 mm.

Due to their compact size, these sensors can also be integrated into restricted spaces.

Adjustable mounting adapter

The adjustable JMA mounting adapter simplifies the alignment and fine adjustment of interferometric sensors. The sensors and adapters can be integrated into the machine and aligned directly on site. This corrects, e.g., minor deviations caused by mounting and compensates for tilted measuring objects. With two-sided thickness measurements, the mounting adapter supports the fine alignment of the two measuring points.
